

Neural network classifiers – Lesson overview

Learning objectives:

- Identify and describe the primary components of a neural network, including its layers, neurons, and activation functions.
- Understand the sequence and methodologies involved in the training process of neural networks, including weight initialisation and batch processing.
- Comprehend the design and function of feed-forward neural networks, emphasising the role of fully connected (or dense) layers.
- Apply knowledge of neural network structures in practical scenarios, particularly in handling and classifying various data types.
